B dell activation protein BL34 - human
N:Alternate names: B-cell activation protein 1r20; regulator of G-protein signaling 1
C:Species: Homo sapiens (man)
C:Date: 13-Jan-1995 #sequence_revision 13-Jan-1995 #text_change 31-Jan-2000
C:Accession: 943436; 156165; 834157
R:Newton, J.S.; Deed, R.W.; Mitchell, E.L.D.; Murphy, J.J.; Norton, J.D.
Biochim. Biophys. Acta 1216, 314-316, 193
A:Title: A B cell specific immediate early human gene is located on chromosome band 1.
A:Reference number: $43436; MUID:94060109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Accession: PC7066
A; Molecule type: protein
A; Molecule type: protein
A; Residues: 88-168 <SA2>
A; Experimental source: embryo
C; Comment: This protein has function as a GTP
genesis and cell differentiation.
C; Superfamily: B-cell activation protein Bi34
C; Keywords: differentiation; embryo

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to disgnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This

                                                                              This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC)
                                                                                                                                                                                      Tumor-suppressing protein conductin diagnosis of tumors

The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through engative regulation of the Wnt pathway in the Nieuwkoop Center.

The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for the compositions with the composition of the composition of the compositions are also useful for the compositions

libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immuno and disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The RGS (regulators of G-protein signaling) protein genes, clones AAH16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for adding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel regulator of G-protein signaling useful as diagnostic and investigative signaling disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, antiferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. This is the amino acid sequence of a novel human regulator of g-protein signalling, termed RGPS-2. It was deduced from a consensus nucleic acid sequence (see AAV45442) desived from thymus and other cDNA clones. RGPS-2 shares 46% and 37% identity with human BL34 and RGS4, respectively. It shows significant expression in inflammed, immortalised or cancerous cells and tissues. The invention provides 2 regulators of G-protein signalling, i.e. RGPS-2 and RGPS-1 (see AAM30560). The invention signalling, i.e. RGPS-2 and RGPS-1 (see AM30560).
                                                                                                 oligonucleotides, peptide nucleic acids, fragments, portions or antisense molecules, and expression vectors and host cells. It also features antibodies specific for RGPS, and pharmaceutical

                                                                                                                                        Matches
                                                                                                                                                                  Query Match
                                                                                                                                                                                                                        This amino acid sequence represents the human p26 protein. The encoding gene sequence was isolated from a human thymus cDNA library by phage plaque hybridisation using the rat p26 cDNA sequence (AAV19303) as a probe. The screening isolated the corresponding 889 bp sequence. p26 protein is useful as a reagent for screening for compounds having dephosphorylase inhibitory activity. It is also useful as a treating preventive agent for diseases related to the haematogenic system.
                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                        The invention relates to isolated RGS-guanine nucleotide exchange factor (CEF) polypeptides. The novel isolated RGS-GEF polypeptide consists of CC an RGS domain of a GEF protein and does not comprise a db1 homology (DH) CC domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides CC can be used for modulating an activity of a G protein alpha subunit (CGAS). The products can be used for the regulation of biological pathways in which a RGS-GEF polypeptide is involved, particularly pathological cc conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth CC control, stress fiber formation, and integrin-mediated interactions, such as embryonic development, tumor cell growth and metastasis, cc programmed cell death, hemostasis, leukocyte homing and activation, bone creasorption, clot retraction, and the response of cells to mechanical stress. The products can also be used for detection, diagnosis and correction of transgenic animals. Sequences AAY41014-028 represent RGS cregions of several proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
